Summary

AI Engineer with LLM/RAG, computer-vision, and deployment experience. Final-year ICT student at USTH who ships AI systems end to end — retrieval-augmented assistants, vision inspection models, FastAPI services, and containerized model serving. Led a 4-person team to a gate-accepted, publicly deployed AI assistant; completed a 3-month AOI inspection internship on NVIDIA SMT lines at Foxconn.

Skills

Programming: Python, C++, JavaScript

AI / Machine Learning: LLM applications, RAG, pgvector retrieval, tool-calling workflows, Computer Vision, YOLOv8, PyTorch, TensorFlow Lite, ONNX Runtime

Backend: FastAPI, REST APIs, SSE streaming, PostgreSQL/Supabase, SQLite, MongoDB

Infrastructure: Docker, Docker Compose, Kubernetes, NVIDIA Triton Inference Server, GitHub Actions CI, Railway

Frontend: React, Next.js, Vue.js, Vite

Developer Tools: Git

Observability: Grafana, Loki, Promtail, OpenTelemetry

Languages: Vietnamese, English (C1), French (B1)

Experience

AI Vision Inspection (AOI) Intern, Foxconn Fuyu Precision Component — Vietnam Apr–Jun 2026

- Evaluated automated optical inspection model outputs on NVIDIA SMT lines, adjudicating true defects against false calls to measure inspection accuracy in production.
- Labelled PCB defect images against the production defect taxonomy and reported recurring misclassification patterns to AOI engineers, feeding model and workflow tuning.

Projects

AOI PCB Inspection & Monitoring Platform | Solo Project | [GitHub](#) 2026

Tech: YOLOv8 • PyTorch • FastAPI • React • SQLite • Docker • Loki • Promtail • Grafana

- Built and containerized an AOI review workstation with FastAPI, React, SQLite, REST APIs, inspection logging, and defect traceability.
- Developed a YOLOv8/PyTorch ML workstream on a 2–3 GB PCB dataset with reproducible training and evaluation pipelines.
- Engineered and tested a FastAPI → JSONL → Promtail → Loki → Grafana monitoring pipeline across 9 anomaly scenarios and 3 alert rules; delivered 1.25 s median event freshness over 10 trials with 1,000/1,000 events visible in Loki.

MoveInMate — AI Resident Onboarding Assistant | Team Lead, Team of 4 | [GitHub](#) 2026

Tech: Python • FastAPI • Supabase (pgvector) • Gemini • Groq • Next.js • Docker • OpenTelemetry • Railway

- Led a 4-person team across 10 sprints to a gate-accepted MVP; deployed three services — resident app, management console, FastAPI backend — publicly on Railway.
- Built the Vietnamese-first RAG path: Gemini embeddings → pgvector retrieval → Groq answers with scoped citations, safe escalation, and a confirm-then-approve vehicle-registration workflow under human review.
- Cut chat latency with SSE token streaming, a keyword fast path, and a single-round-trip turn RPC (3 calls → 1); 924 backend tests and Ruff gate every merge in CI.

V-Hand 2.0 — Smart Sign Language Glove | Team of 4 | [GitHub](#) Aug 2025–May 2026

Tech: Python • C++ • ESP32 • TensorFlow Lite • FastAPI • MongoDB • React • Vite

- Co-developed a real-time embedded-AI glove using flex sensors and an IMU to classify gestures from 11 sensor values and synthesize speech.
- Implemented TensorFlow Lite inference, ESP32 C++ firmware, and a FastAPI/MongoDB backend for gesture data, training, and prediction workflows.
- Earned First Prize at the national-level APEC Innovation 2025–2026 competition.

Education

University of Science and Technology of Hanoi (USTH), Bachelor in Information and Communication Technology — Hanoi, Vietnam Aug 2023–Aug 2026

- Final-year student completing bachelor's thesis; expected graduation August 2026.

Awards & Activities

- First Prize**, APEC Innovation 2025–2026 (National Level) — May 2026
- Consolation Prize**, USTH Student Scientific Research Competition — August 2025
- Consolation Prize**, VNU English Olympiad
- Certificate of Appreciation**, coordination for President Emmanuel Macron's visit to USTH
