Summary

AI Systems Engineer / Computer Vision Engineer with backend and deployment experience. Final-year ICT student at USTH with hands-on experience in industrial AOI, computer vision, backend systems, containerized deployment, and model serving. Completed a 3-month NVIDIA SMT ME AOI internship at Foxconn and built AI systems spanning PCB inspection, inference monitoring, embedded gesture recognition, and GPU model serving.

Skills

Programming: Python, C++, JavaScript

AI / Machine Learning: Computer Vision, YOLOv8, PyTorch, TensorFlow Lite, ONNX Runtime, model training and evaluation

Backend: FastAPI, REST APIs, PostgreSQL, SQLite, MongoDB

Infrastructure: Docker, Docker Compose, Kubernetes, NVIDIA Triton Inference Server

Frontend: React, Vue.js, Vite

Developer Tools: Git

Observability: Grafana, Loki, Promtail

Languages: Vietnamese, English (C1), French (B1)

Experience

NVIDIA SMT ME AOI Intern, Foxconn Fuyu Precision Component — Vietnam Apr–Jun 2026

- Verified and classified PCB defects within NVIDIA SMT ME AOI workflows during a 3-month internship, supporting manufacturing quality-control decisions.
- Reviewed AI-assisted inspection outputs and defect categories with AOI engineers to identify misclassifications and support process improvements.

Projects

AOI PCB Inspection & Monitoring Platform | Solo Project | [GitHub](#) 2026

Tech: YOLOv8 • PyTorch • FastAPI • React • SQLite • Docker • Loki • Promtail • Grafana

- Built and containerized an AOI review workstation with FastAPI, React, SQLite, REST APIs, inspection logging, and defect traceability.
- Developed a YOLOv8/PyTorch ML workstream on a 2–3 GB PCB dataset with reproducible training and evaluation pipelines.
- Engineered and tested a FastAPI → JSONL → Promtail → Loki → Grafana monitoring pipeline across 9 anomaly scenarios and 3 alert rules; delivered 1.25 s median event freshness over 10 trials with 1,000/1,000 events visible in Loki.

RAInder — GPU Image Upscaling Service | Solo Project | [GitHub](#) 2026

Tech: Python • JavaScript • FastAPI • NVIDIA Triton • ONNX Runtime • Docker Compose • React

- Built a FastAPI inference gateway with health, readiness, and upscaling endpoints, automated API coverage, and a React upload and model-comparison interface.
- Containerized the gateway and Triton model repository with Docker Compose; validated local GPU serving and an ONNX CPU fallback.
- Added regression coverage for model normalization and output handling plus repeatable local model-comparison tooling.

V-Hand 2.0 — Smart Sign Language Glove | Team of 4 | [GitHub](#) Aug 2025–May 2026

Tech: Python • C++ • ESP32 • TensorFlow Lite • FastAPI • MongoDB • React • Vite

- Co-developed a real-time embedded-AI glove using flex sensors and an IMU to classify gestures from 11 sensor values and synthesize speech.
- Implemented TensorFlow Lite inference, ESP32 C++ firmware, and a FastAPI/MongoDB backend for gesture data, training, and prediction workflows.
- Earned First Prize at the national-level APEC Innovation 2025–2026 competition.

Education

University of Science and Technology of Hanoi (USTH), Bachelor in Information and Communication Technology — Hanoi, Vietnam Aug 2023–Aug 2026

- Final-year student completing bachelor's thesis; expected graduation August 2026.

Awards & Activities

- **First Prize**, APEC Innovation 2025–2026 (National Level) — May 2026
- **Consolation Prize**, USTH Student Scientific Research Competition — August 2025
- **Consolation Prize**, VNU English Olympiad
- **Certificate of Appreciation**, coordination for President Emmanuel Macron's visit to USTH
